Learn how new functionality in AgileOps improves automatic alarm mapping with DeltaV.

The AgileOps suite provides modular and scalable applications for dynamic alarm management, SIF tracking, input tracking, and standard reports on key KPIs. Collected event data is transformed into reports and dashboards to better understand how your site is performing individually or compared to other sites within your organization.

AgileOps v3.FP2 simplifies integration with DeltaV by automatically syncing with alarm lists, functional class, priorities for alarm templates and connections, and boundaries with Alarm Help. With new functionality, a simple click allows synchronization with DeltaV configuration and misconfiguration is easily recognized. Join us for a demonstration of new and improved features of including:

- Localize timestamps for global AgileOps servers
- Assign security roles to Master Control System Database approvals
- Audit or enforce by area or system
- Audit or enforce only alarm trip point values if desired
- Shelve multiple alarms at a time from the operator console
- Improved automatic alarm mapping for DeltaV
- Quick shelve from DeltaV faceplate mini alarm list
- Update boundary type to sync with DeltaV alarm functional class
- Show unmapped alarm priorities and categories in DeltaV
- Auto sync active alarm lists with DeltaV
- Automatic import of DeltaV Alarm Help and link to boundaries
